Part I
Introduction

1 What is this?

This is the A3S Repo Updater. Or Arma3Sync-Repository Updater.
I made this because creating Repositories for Arma3Sync is enough of a hassle. So I made updating the Mods more or less automatic, but definitely easier.
You now can easily add mods to a config file or use the wizard wich also enables you to remove active mods and enable mods.

2 How does this work?

The mods get downloaded from the Steam Workshop, for wich you need a account with a valid Arma3 License, or from Github via cloning from master or using the latest download option. You can also define a download location yourself.

Part II
A3S-Repository Updater

3 Install A3S-Repo Updater

3.1 Requirements

- python3
- pip
- git
- Arma3Sync
- SteamCMD

3.2 Installation

```
git clone https://github.com/IceT-Clan/A3S-Repo-Updater
```

4 How to use A3S-Repo Updater

When running A3S-Repo Updater for the first time (or you don't have a repo.cfg) you will be prompted with a setup installing SteamCMD and Arma3Sync. After that you can use A3S-RU like normal.
